The MAILING DATE of this communication app Period for Reply	ears on the cover sheet with the c	orrespondence address					
A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION. - Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication. - If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely. - If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication. - Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).							
Status		,					
1) Responsive to communication(s) filed on 25 Oc	ctober 2004.						
Since this application is in condition for allowance except for formal matters, prosecution as to the merits is							
closed in accordance with the practice under Ex parte Quayle, 1935 C.D. 11, 453 O.G. 213.							
Disposition of Claims							
4)⊠ Claim(s) <u>50-97</u> is/are pending in the application	•						
4a) Of the above claim(s) is/are withdrawn from consideration.							
5) Claim(s) is/are allowed.							
6)⊠ Claim(s) <u>50-97</u> is/are rejected. 7)□ Claim(s) is/are objected to.	S) Claim(s) <u>50-97</u> is/are rejected.						
8) Claim(s) are subject to restriction and/or	election requirement

Art Unit: 1711

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after allowance or after an Office action under *Ex Parte Quayle*, 25 USPQ 74, 453 O.G. 213 (Comm'r Pat. 1935). Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, prosecution in this application has been reopened pursuant to 37 CFR 1.114. Applicant's submission filed on October 25, 2004 has been entered.

- 2. Though prosecution has been reopened, applicants are reminded that the examiner's amendments attached to the Notice of Allowance of April 2, 2004 remain in effect. Future claim listings submitted within amendments must reflect these changes.
- 3. Claims 82 and 83 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Within claim 82, the language, "cap layer cap layer", is incorrect.

Within claim 83, it is unclear which "plasma based process" is being referred to. Does the language refer to the "plasma based process" language that is associated with the adapted cap layer language (line 6 of claim 80) or does the language pertain to the "different plasma process" that was referred to as "a second plasma based process" (lines 15 and 16 of claim 80), prior to amendment?

- 4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Art Unit: 1711

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

5. Claims 50-97 are rejected under 35 U.S.C. 103(a) as being unpatentable over Tobben et al. ('126) in view of JP 8-288285.

Tobben et al. disclose the production of semiconductor devices containing electrically conductive wires on a substrate, wherein the method comprises the etching of a layered composite comprising a substrate layer, a titanium/titanium nitride layer (corresponding to applicants' surface layer of claims 61 and 84), an aluminum wiring line layer, an antireflective coating layer of titanium/titanium nitride (corresponding to applicants' protective layer of claim 61 and applicants' antireflective coating of claim 80), and a cap layer. See figures and columns 2-4, especially column 2, lines 32-46 and column 3, lines 6+. Tobben et al. further teach at column 4, lines 10-26 that if an additional metalization layer is to be used, then a layer of dielectric material is deposited over the surface of the structure and within the grooves between the wiring lines. Tobben et al. additionally teach that this layer may be formed by depositing silicon dioxide using high density plasma deposition techniques. The subject matter of claims 53 and 63 is considered to be a characteristic of the disclosed deposition process. The subject matter of claims 54 and 64 is disclosed at column 3, line 13. The subject matter of claim 55 is

Application/Control Number: 09/546,174

Art Unit: 1711

Page 4

disclosed by the figures. The subject matter of claim 59 is considered to be a characteristic of the etching process, given that the degree of the etching away of the corners is not specified. The subject matter of claims 60 and 69 is considered to be a characteristic of the disclosed deposition process. Similarly, the subject matter of claims 86 and 87 is considered to be a characteristic of the disclosed process. The subject matter of claims 65-68 is disclosed within column 4, lines 5-18. The claimed subject matter pertaining to the differences in dielectric constants between respective layers is considered to be disclosed by Tobben et al. in that Tobben et al. disclose that these layers are formed from different materials; therefore, it follows that the respective layers would have different dielectric constants.

- 6. With respect to claims 56-58 and 87, while Tobben et al. specifically disclose rectangular gaps or grooves, patentees fail to recite other cross-sectional shapes for the grooves, such as trapezoidal or triangular cross-sections; however, the position is taken that the production of such shapes by controlling the parameters of the etching process was known and conventional at the time of invention. Accordingly, the selection of such cross-sections amounts to an obvious design choice and the implementation of such choices requires only the control of result effective variables.
- 7. Tobben et al. are silent with respect to applicants' modification of the cap layer to display destructive interference (claims 50 and 61), applicants' use of the cap layer as a hard mask (claims 51, 62, and 82), and applicants' use of a different plasma process after the initial use of a HDPCVD process (claim 80). However, each of these features was known within the semiconductor processing art and/or etching art at the time of invention. This position is supported by the teachings of JP 8-288285. Firstly, JP 8-288285 discloses at pages 10 and 11 of

the translation that the composition (optical constant) and thickness of the protection insulating

film (cap layer) are optimized so that during photolithography, an interference effect is created to

minimize reflection. Secondly, JP 8-288285 discloses at pages 10 and 12 that the cap layer can

be used as a mask for patterning the wiring lines. Therefore, the position is taken that it would

have been obvious to modify the cap layer of Tobben et al. in accordance with these known

techniques so as to yield a more efficient process and higher quality product. One would have

expected that the greater control of the patterning or masking of the layers afforded by these

modifications would have yielded a product having a more precise wiring line pattern with less

defects. Lastly, JP 8-288285 discloses at page 20 and page 25, lines 14-19 that the planarizing

layers can be applied using multiple deposition steps or processes. Therefore, in accordance with

the teachings of the secondary reference, the position is taken that it would have been obvious to

subsequently use a deposition process different from the initially used HDPCVD process, so as

to obtain an optimized or more finely planarized surface.

Any inquiry concerning this communication should be directed to R. Sergent at telephone

number (571) 272-1079.
